# WVMA Guide to emergency animal disease

## *What to look for*

As veterinarians, we need to be continually vigilant for the appearance of foreign animal diseases. It is equally important to note that many endemic animal diseases are clinical “look-alikes” for foreign animal diseases. These serious endemic diseases and their foreign animal disease counterparts both constitute emergency animal disease. Recognition of one or more of the following clinical syndromes should be immediately reported to state or federal veterinary officials (see reverse side), especially if multiple animals are involved.

- Unexplained deaths
- High fevers
- Suddenly increased rates of abortions
- Blisters or ulcers in the mouth, on the nose or teat
- Blisters or ulcers on the coronary band, bulbs of the heels or in inter-digital spaces, and or unexplained lameness
- Profuse salivation
- Unexplained neurologic signs  
(such as ataxia, seizures, blindness)
- Unusual hemorrhages
- Severe diarrhea
- Unusual maggots, ticks or other parasites
